Amine Oxidases in Clinical Research discusses the functions of amine oxidases in the rapid development of medical and biological research. Composed of 13 chapters, the book focuses on amine oxidases, including their key role in the metabolism of biogenic amines and other nitrogenous compounds in diseases and human health.

Amine Oxidases in Clinical Research discusses the functions of amine oxidases in the rapid development of medical and biological research. Composed of 13 chapters, the book focuses on amine oxidases, including their key role in the metabolism of biogenic amines and other nitrogenous compounds in diseases and human health. The book considers primarily the enzymes denoted as EC 1.4.3.4 (flavin amine oxidases or monoamine oxidases) and EC 1.4.3.6 (copper-containing amine oxidase or diamine ...

In this review on the involvement of amine oxidases in the metabolism of xenobiotics, the major characteristics reported for the CYP system (protein, reaction, tissue distribution, subcellular localisation, substrates, inhibitors, inducers, genetic polymorphism, impact of different physiopathological conditions on the activity, turnover) will be compared, whenever possible, with the ...

The overall reaction catalyzed by the TPQ-dependent copper amine oxidases is the conversion of a primary amine substrate into its corresponding aldehyde plus ammonia with molecular oxygen and water as co-substrates and H<sub>2</sub>O<sub>2</sub> as an additional product.

Monoamine oxidase is a mitochondrial enzyme involved in the catabolism of biogenic amines. Monoamine oxidase A, the primary type in fibroblasts, preferentially degrades serotonin and norepinephrine. Monoamine oxidase B, the primary type in platelets and in the brain, preferentially degrades phenylethylamine and benzylamine.

The amine oxidase inhibitors continue to be of considerable interest and the subject of extensive research. Some of them may prove useful for treating some neurodegenerative disorders and stroke, either alone or in combination with other drugs. In fact, their multifaceted nature may be an advantage, making them suitable for treating several disorders. They continue to be valuable ...

Amine oxidases are important because they contribute to regulate levels of mono- and polyamines. These enzymes catalyze the oxidative deamination of biogenic amines and polyamines to generate the reaction products H<sub>2</sub>O<sub>2</sub> and aldehyde(s) that are able to induce cell death in several cultured human tumor cell lines.
